

Ellipse Multiflex Veins Treatment

靜脈治療

Introduction

The latest Ellipse veins treatment uses a specific type of laser (an Nd:YAG laser) to treat enlarged vessels which mostly found on faces and legs.

Clinical Efficacy

Improvement appears after 3 to 6 treatments in average. Results may vary depends on the areas of the treatment, the number of veins and the expectation towards the treatment.

Scope of Treatment:

- Face Veins
- Leg Veins

Procedure

Detailed assessment of patient will be carried out by your dermatologist before advice is given on the most appropriate course of treatment. During the treatment, patients are required to wear goggles, and experience the cooling techniques to minimise pain and protect the surrounding skin from over-heating. Most adult patients could tolerate treatment without anaesthetic. Redness or swollen skin may appear after the treatment, and will go away after 48 hours. Some patients may experience bruises and increase pigmentation on treatment area but will usually disappear in four weeks or more.

Post-treatment Care

During the next 7 days after the treatment:

- Avoid over exposure to sunlight
- Avoid steam bath or spa
- Avoid rubbing to treatment area
- Apply moisturiser if required

From the 5th day after the treatment:

- Use sunscreen if going outdoors

Note: 1. Result may vary. Please consult your doctor in advance.
2. For referral cases, please call our Skin and Laser Centre for more information.

Service Hours (By appointment only)

Mon to Wed, Fri	10:00 am – 6:00 pm
Thur	10:00 am – 1:00 pm
Sat	09:00 am – 1:00 pm
Closed on Sunday and public holidays
