

## Procedure Information Sheet

### Introduction

Monochromatic excimer light is a light with a wavelength of 308nm. It is presumed to alter immune response to the treated areas and is found to be useful in the treatment of vitiligo, psoriasis, alopecia areata and mycosis fungoides. For vitiligo, it has been shown to be more effective than traditional narrow band UVB light in obtaining repigmentation. Apart from its immunomodulating effects, it is thought to work by stimulating melanin production and recruitment of melanocytes from the adjacent skin.

### Indications

1. Vitiligo
2. Alopecia areata
3. Psoriasis
4. Mycosis fungoides

### Before the Operation / Procedure

1. Treatment is usually painless but there might be some minor discomfort.
2. Treatment is usually 1-2 times a weekly for about 12 weeks, depending on response.
3. Multiple treatments (> 30) are usually required for improvement and total clearance may not be possible.
4. Clinical results vary and there is no guarantee to the final outcome of the treatment.
5. Recurrence is possible.
6. Photographs will be taken before and after the procedure.

### After the Operation / Procedure

1. Routine skin care products and makeup may be used immediately after the procedure.
2. Apply sunscreen and avoid exposure to sunlight.

### Risks and Complications

1. Redness, swelling, blistering, infection, unpredictable scarring, hyper- or hypo- pigmentation of the treated and adjacent skin.
2. Hyperpigmentation which may appear as a ring around the vitiligo, may last for 1-12 months or longer.

### Disclaimer

This leaflet only provides general information pertaining to this operation / procedure. While common risks and complications are described, the list is not exhaustive, and the degree of risk could also vary between patients. Please contact your doctor for detailed information and specific enquiry.
